Pilot pressure regulator 8042

Series GS 1, DN 15 to DN 150

Pneumatic regulator for continuous and discontinuous pressure control of gases and vapours.

- High dynamics and control quality (significantly better than with self-mediumcontrolled pressure reducers)
- External or manual setpoint specification
- Compact and uncomplicated design of valve and controller
- Extremely light weight
- Meets the requirements of TA-Luft 2021

Connections:

 P
 supply air

 X
 Actual value (pressure to be controlled)

M Pressure gauge (if required) W Target value

A Output to the valve drive

Technical specifications

Valve							
design	Intermediate flange design Overall length according to DIN EN 558-1 series 20 for flanges according to DIN EN 1092-1 form B For further designs, see data sheet 8042- GS3						
nominal widths	DN15 - DN150						
Nominal pressure (according to DIN 2401)	PN 40 (suitable for PN 10-40)						
media temperature	- 10°C to +230°C						
flange gaskets (customer side)	DIN EN 1514-1 or ANSI B16.21 in the respective nominal pressure le

Pilot pressure regulator 8042-GS1

functionality

The gas or vapor pressure to be controlled in a part of the system (pressure chamber or pipeline) is fed to a membrane system in the controller and compared there with the manually or pneumatically specified setpoint. Depending on the result of this comparison, control air is then fed to the valve drive through a nozzle system or it is blown off. This changes the valve opening and flow and ultimately the controlled variable (pressure). The controller can be used both in discontinuous processes with a variable setpoint and in continuous pressure control (eg the "classic" pressure reduction of steam) (examples on the last page of this data sheet). Note: This controller is a P-controller with a very high gain. He can

Therefore, in controlled systems that are difficult to control in terms of control technology, for example due to dead time components, do not replace a conventionally designed control device.

However, practical experience has shown that many pressure control systems can be easily controlled with it. In order to minimize this application risk, we recommend a technical consultation before use, the effort of which is definitely worthwhile due to the potential savings that can be achieved with this system (no pressure sensor and system controller necessary).

Application examples

Pressure control in a closed volume:

The pressure in a steam-loaded chamber should follow a time-variable set value, which is determined by the system control (eg PLC) and is initially available as a current signal. This is converted into a pressure signal by an electropneumatic (i/p) converter and fed to the pilot pressure regulator. The actual value of the vapor pressure is recorded via a control line, which also acts as a cooling section for the membrane system of the regulator.

Vapor pressure reduction in a supply line:

The pressure in a steam supply should be kept constant regardless of the extraction quantity and fluctuations in the inlet pressure. Due to the high dynamics of this system, the outlined solution is also suitable for rapidly and strongly fluctuating flow rates.

Permissible differential pressures (for temperatures up to 120°C)

Pairing: carbon material-stainless steel coated

SFC coated stainless steel
